

The background of the slide is a photograph of the main facade of the TU Wien building. The building is a grand, multi-story structure with a light-colored facade, numerous windows, and classical architectural details like columns and statues. A large, leafy green tree is visible on the right side of the frame. The sky is clear and blue.

Model-Context-Protocol

A brief overview

Industrial AI, 2026S

1. What is MCP?
2. Why is MCP relevant?
3. Technical overview
4. Live demo

- MCP** MCP = **Model Context Protocol**
- Standardized way for AI to access external tools
- Separates:
 - **AI model** (reasoning)
 - **Tools/data** (execution)
- Works like “APIs for AI agents”
- Enables structured tool usage instead of plain text guessing

❌ LLMs alone:

- hallucinate
- no real-time data
- no system access

✅ MCP enables:

- real data access
- actions (not just answers)
- reliable, grounded responses

? Example questions where MCP is useful:

Which products are low in stock?

Create a new transport order.

What should I reorder this week?

Analyze anomalies in inventory.

MCP enables a shift from AI that only talks,
to AI that acts within real systems.
